

Application: Automatic boom barrier opening

CUSTOMER ISSUE:

When there is a vehicle, boom barriers must be opened in parking zones. In a manual system, the security guard or driver must get out of the car and operate the switch to open the boom barrier.

OUR SOLUTION:

We proposed using a Carlo Gavazzi loop detector, which detects vehicles and sends a command to the boom barrier controller to open it.

ACHIEVED BENEFITS:

Both time and human involvement are reduced. There is no need for a security guard, which saves money.

PRODUCT USED IN THE APPLICATION:
